**ABSTRACT**

The features and settings of wireless devices, such as cellular and cordless telephones, can be configured through the use of a user friendly web page, website, e-mail menu or the like. After a user has identified a wireless device or devices to configure, she then selects the features and settings she desires. The selected settings are then transmitted to the identified wireless device or devices. In this manner, wireless devices can be remotely configured and there is no need to repeat identical steps to configure multiple devices with the same configuration.
